measuring instruments test benches

verification

- Operation making it possible to observe that the differences between the values indicated by a measuring device or its measuring system, or the values represented, and the corresponding known values of a measured quantity, are less than the tolerated errors.

ajustment

- Operation consisting in bringing the device to an operation and an accuracy suitable for its use and to resume only the settings corresponding to the measurement points out of tolerance or at the limit thereof.

calibration

- Operation consisting in returning the device to its level of optimal precision and to resume the settings, adjustments and to adjust the passive elements provided by the manufacturer so that the device is at its level of optimal precision.

repair

- The repair intervention corresponds to all the activities carried out after the failure of an asset, or the degradation of its function, to enable it to perform a required function.

calibration time / frequency

- Operation making it possible to measure the differences in time / frequency quantities with a reference standard "rubidium frequency controlled by GPS".
