PRESS RELEASE

HEMERIA joins Saber Astronautics' RSOC Space Domain Awareness Marketplace

Saber Astronautics is pleased to welcome HEMERIA as the newest supplier in Saber's Responsive Space Operations Centre® (RSOC) SDA marketplace. HEMERIA will make its space surveillance data available through the RSOC SDA Marketplace, expanding the range of independent commercial data sources available to satellite operators, governments and defence organisations.

10 September 2026

The RSOC is Saber Astronautics' mission operations and space traffic support program. With sites in the United States and Australia, the RSOC provides global, follow-the-sun operations for civil and defence flights. Its SDA Marketplace connects customers with a network of commercial sensor and data providers.

The US RSOC, based in Colorado, produces the Space Battle Management System® (SBMS) which is used across US Space Force Combat Commands. The Australian RSOC, co-located at the Australian Space Agency HQ in Adelaide, served as the Pacific night shift for US Space Command's Joint Commercial Operations for nearly 4-years. The RSOC also flies commercial satellites, roughly 42 tons in orbit today.

HEMERIA provides Low Earth Orbit space situational awareness data using ground-based radars. Its service is based on its growing network of SYRAH radars, survey radars based on the same technology as GRAVES, the French Air Force radar, heritage from the ONERA (the French Aerospace Lab). This capability allows HEMERIA to maintain an independent catalogue of more than 15,000 objects and generate over 200,000 measurements each day, supporting active satellite and debris monitoring.

Adding HEMERIA strengthens the RSOC with European sensor coverage and adds new source of high-volume radar observations.

"HEMERIA brings a mature and highly capable European radar service to the RSOC. Its extensive daily volume can providevaluable additional coverage for our customers. We are delighted to welcome HEMERIA and deepen our friendship with the French and European space communities."

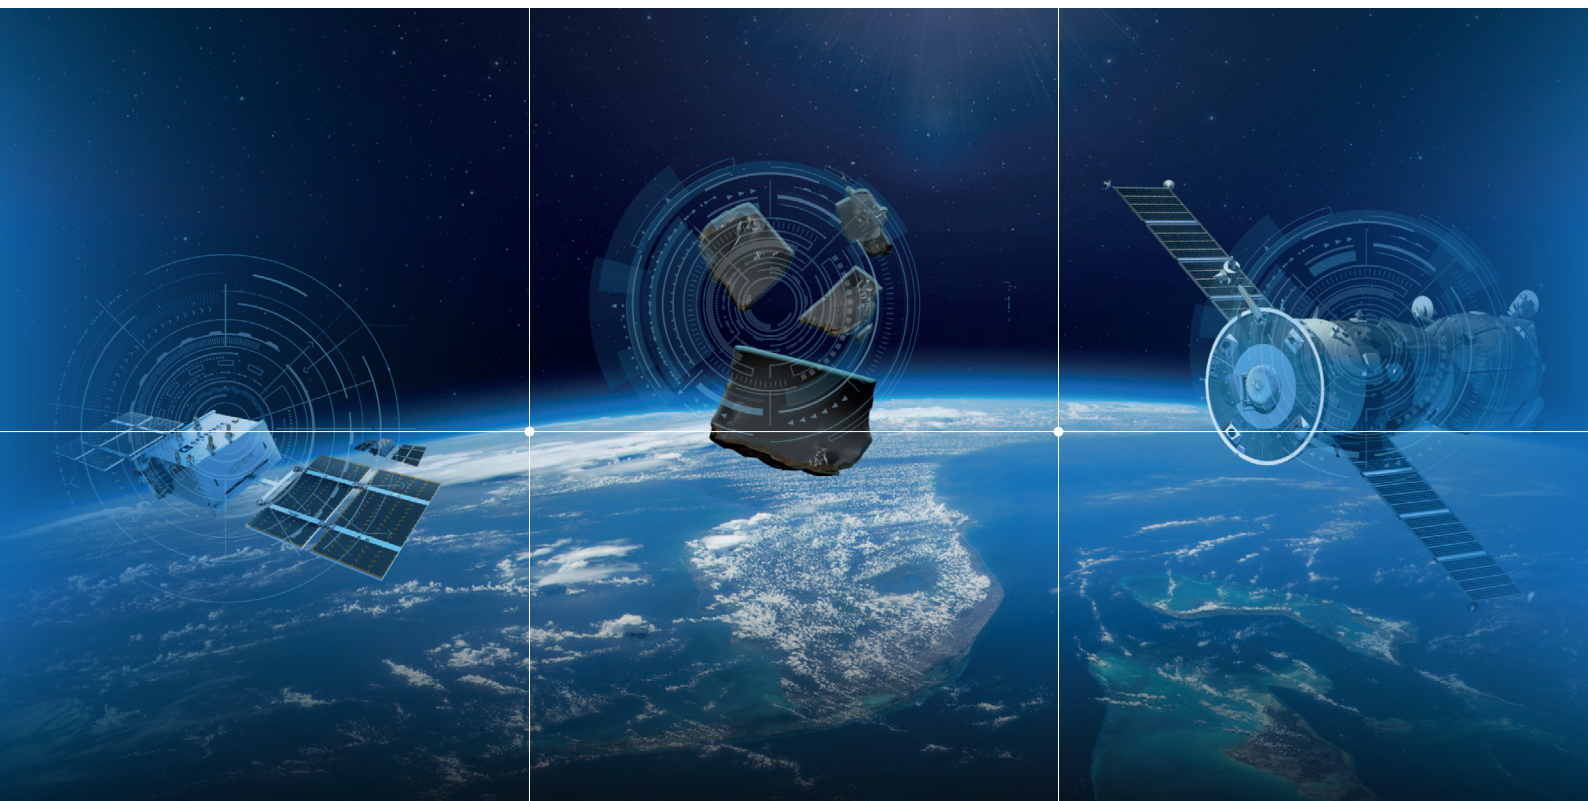

Dr Jason Held,
CEO of Saber Astronautics

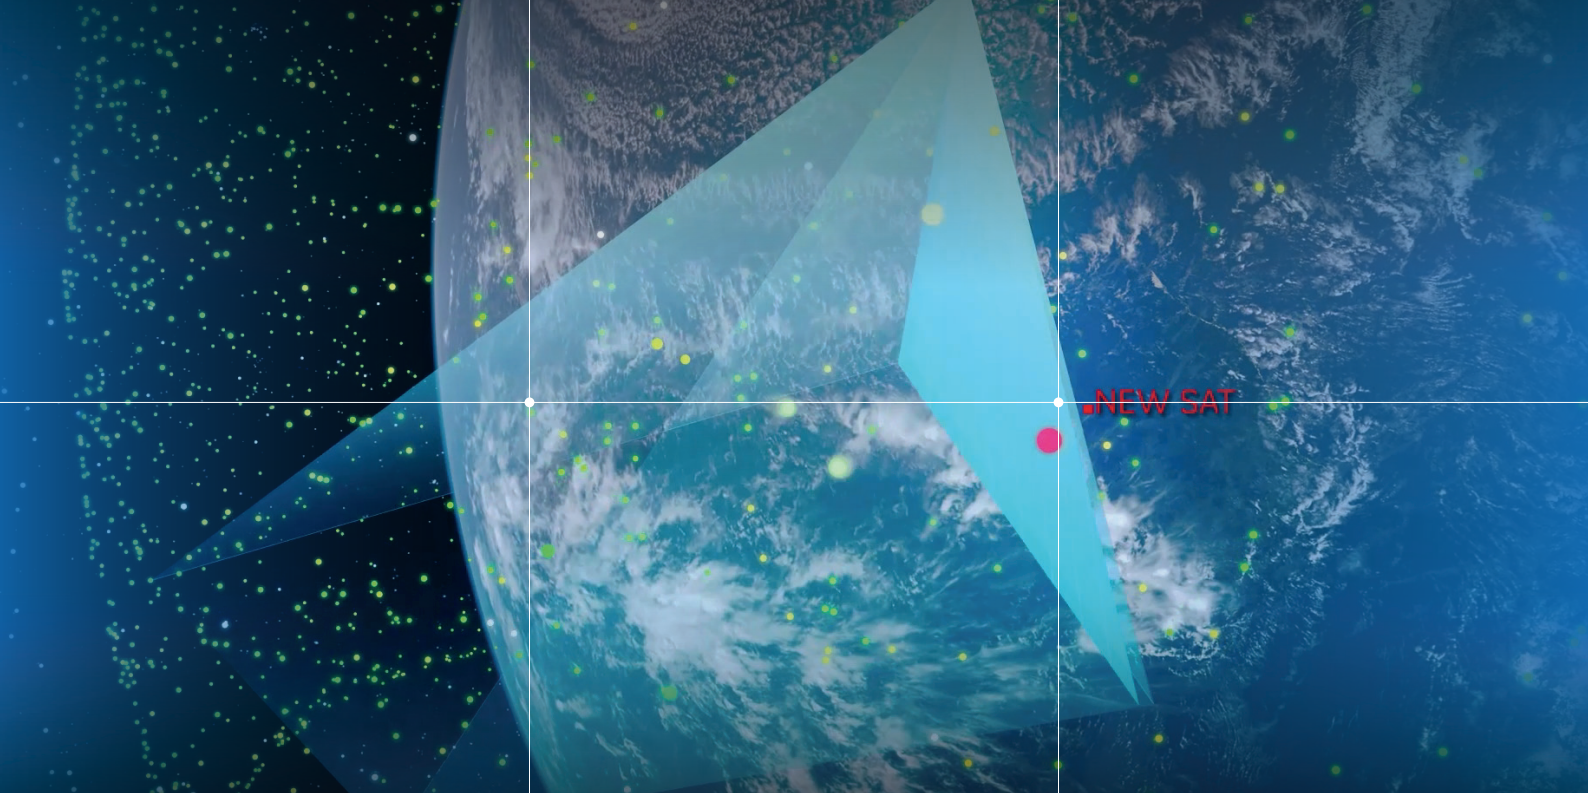

"Joining the RSOC SDA Marketplace represents an important milestone in HEMERIA's international development and reinforces our ambition to play a leading role in the future of Space Situational Awareness."

Through our SYRAH radar network and our independent catalogue, we are bringing a sovereign European capability to the global space surveillance ecosystem—one that is highly effective, complementary to existing assets, and designed to address the growing challenges of an increasingly congested orbital environment.

I am particularly proud of this cooperation with Saber Astronautics. By combining our respective data, technologies and expertise, we are strengthening our collective ability to make space operations safer and more resilient. I strongly believe that international cooperation, built on trusted and complementary capabilities, is essential to better protect critical assets in orbit and ensure the sustainable use of space."

Nicolas Multan
Chairman of HEMERIA

About Saber Astronautics

Saber Astronautics' mission is the democratization of space, reducing barriers to flight, and making space as easy as driving a car. Incorporated in 2007, Saber provides space operations, mission design services, and related software. Saber has R&D laboratories and mission control centres in the USA and Australia, being a trusted supplier to government and commercial companies worldwide.

About HEMERIA

At HEMERIA, we support our customers in the design and development of mission-critical technology systems for the Defence and Security sectors.

We address four strategic challenges: observation, detection, communication and protection, operating from the depths of the oceans to the far reaches of space.
